\_ANDESK\* SOLUTION BRIEF PATCH MANAGEMENT

availability and speed deployment to all affected machines at once.

The LANDesk patch management solution monitors the status of each install and displays that status on-screen so you can quickly and easily track remediation and ensure that each patch reaches its target.

When remediation is complete, IT can audit each target machine to ensure correct configuration and report successful remediation. The result is that most patches can be installed quickly, easily and automatically while IT works on other tasks. IT can spend time only on those machines that require it.

#### Policy-based maintenance

Once current vulnerabilities are assessed and remediated, IT can use powerful policy-based configuration management tools to automate patch maintenance.

LANDesk® patch management can leverage application policies to assess and remediate a machine's vulnerabilities based on OS, configuration, organizational role or any LDAP attribute tracked by your directory service system.

Because policy-based management can implement policies based on both machine inventory and directory service attributes, IT can refine policies as needed to ensure patch security and currency.

#### Heterogeneous platform support

LANDesk® patch management supports both client and server platforms for a wide variety of operating systems. Broad platform support helps ensure that the entire enterprise is kept up to date, not just machines running a particular OS. Extended language support means you can protect your IT assets wherever they might be.

#### Rapid results

LANDesk® patch management can begin vulnerability assessment and remediation from the moment it's installed, and can begin remediation on the very first day. The result is that IT can quickly implement and maintain patch-level security across the enterprise in only a few days.

#### Integrated Solution

LANDesk® patch management seamlessly integrates with LANDesk® Management Suite to provide not only quick vulnerability assessment, but rapid remediation and hands-off maintenance—automatically.

By leveraging existing software deployment and automated policy management, LANDesk patch management enables a level of efficiency and control that's virtually impossible with standalone products or bolt-on tools. Download a fully functioning
